Micose: beta-D-galactoside 2-alpha-L-fucosyltransferase.*;

Tucose: beta-D-galactoside 2-alpha-L-fucosyltransferase.*;

J. Biol. Chem. 271:16975-16981(1996).

-! FUNCTION: CREATES A MEMBRANE-ASSOCIATED PRECURSOR OLIGOSACCHARIDE

FUC-ALPHA(1,2)GALBETA-) CALLED THE HANTIGEN WHICH IS AN

ESSENTIAL SUBSTRATE FOR THE FINAL STEP IN THE MEMBRANE-ASSOCIATED

A AND B ANTIGEN SYNTHESIS PATHWAY. HAND SE ENZYMES FUCOSYLATE THE

SAME ACCEPTOR SUBSTRATES BUT EXHIBIT DIFFERENT KM VALUES.

-!- CATALYTIC ACTIVITY: GDP-L-FUCOSYL-R = GDP -

ALPHA-L-FUCOSYL-1, 2-BETA-D-GALACTOSXL-R = GDP -

--- PATHWAY: GLYCOSYLATION.

-!- PATHWAY: GLYCOSYLATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND

C-!- PATHWAY: GLYCOSYLATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND

C-!- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MEMBRANE-BOUND

C-!- STREED SPECIFITY: ADULT GASTRONTESSTINAL FRACT AND COLON.

-!- STREED SPECIFITY: ADULT GASTRONTESSTINAL FRACT AND FUT3) WHICH

ENCODE GALACTOSIDE 2-L-FUCOSYLTRANSFERASE IN RABBIT. THEY ARE

C-!- STREED IN A TISSUE-SPECIFIC MANNER.

-!- STRILANTIY: STRUCTURAL SIMILARITY WITH THE OTHER MAMMALIAN

C-!- STRUCTURAL SIMILARITY WITH THE OTHER MAMMALIAN

NOTE: This is a 'working draft' sequence. It currently consists of 63 contigs. The true order of the pieces is not known and their order in this sequence record is
Rives, M., Rojas, A., Rojubokan, I., Rolfe, M., Ruiz, S., Savery, G., Scherer, S., Socht, G., Shen, H., Shooshtari, N., Sisson, I., Sodergren, E., Sonaike, T., Sparks, A., Stanley, H., Stone, H., Sutton, A., Svatek, A., Tabor, P., Tamerisa, A., Tamerisa, K., Tang, H., Sutton, A., Tavek, A., Tabor, P., Tamerisa, K., Tang, H., Tansey, J., Taylor, C., Taylor, T., Telfrod, B., Thomas, N., Thomas, S., Usmani, K., Vasquez, L., Verra, V., Villalon, D., Vinson, R., Wang, S., Wand-Moore, S., Warren, R., Washington, C., Watlington, S., Wulliamson, A., Wleczyk, R., Wooden, S., Weistock, G., Wulliamson, A., Wleczyk, R., Wooden, S., Weistock, G. and Gibbs, R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

The present sequence is given in a specification relating to a rat ganglioside GM_1-specific alphal-2fucosyltransferase protein. The protein or its cellular fraction is useful for synthesis of a molecule comprising Fucalphal-3Galbetal-3GalNAc.

Fucalphal-3Galbetal-3GalNAc, a glycolipid, glycoprotein, glycolipoprotein or a free oligosaccharide comprising Fucalphal-2Galbetal-3GalNAc.

The method involves contacting alphal-2fucosyltransferase with GDP-fucose and a molecule or glycolipid, glycoprotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3GalNAc group. It is also oligosaccharide having a terminal Galbetal-3GalNAc group. It is also begin for synthesis of fucosyl-GM_1 by contacting the protein with glycolipoproteins, glycolipids and oligosaccharides are useful as nutritional compositions and ducosyl-GM_1 is useful for inducing an immunotherapeutic or immunosuppressive action against cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

The invention relates to rat GMI-specific alphal-2fucosyltransferase
(alphal-2FucT) enzyme and its corresponding nucleic acid. This nucleic
acid is specific for a carbohydrate moiety found in ganglioside GMI,
a terminal galactose betal-1N-acetylgalactosamine (Galbetal-3GalNAc)
saccharide. Alphal-2FucT DNA is useful for producing rat alphal-2FucT
protein by recombinant techniques. Alphal-2FucT DNA is useful for the
preparative synthesis of fucosyl containing glycolipids, glycoproteins,
glycolipoproteins and oligosaccharide, and for preparing fucosyl-GMI.
Alphal-2FucT DNA is useful for detecting oncogenic transformation which
involves assaying for changes in expression of alphal-2 FucT. Since
alphal-2FucT is activated in cell transformation, antisense sequences
derived from alphal-2FucT DNA is useful for inhibiting, suppressing
or treating cancer. Alphal-2FucT DNA is useful in gene therapy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AGCCAGCCGAGTACTTTTGTGGGTGTCCATGTGCGCCGAGGGGACTATGTGCATGTCATG 660
                                                       for producing
                                                 Rat hepatoma H35 cell alphal-2fucosyltransferase, useful for producing GMI-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GIGACTICCACCATCATCCACCICCAGCAGCGAATAGIGAAGCICCAACCCCTGICAGAG

                                                                                                                                                                                                                                                                          The present sequence is given in a specification relating to a rat ganglioside GM 1-specific alphal-Zfucosyltransferase protein. The protein or is useful for synthesis of a molecule comprising Fucalphal-Zdalbetal-3GalNac, a glycolpid, glycoprotein, glycolipoprotein or a free oligosaccharide comprising Fucalphal-ZGalbetal-3GalNac. The method involves contacting alphal-ZGalbetal-3GalNac after molecule or glycolpid, glycoprotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3GalNac group. It is also useful for synthesis of fucosyl-GML by contacting the protein with GDP-fucose and ganglioside GML. The obtained glycoproteins, glycolipoproteins, glycolipoproteins, glycolipoproteins, glycolipoproteins, glycolipoproteins, and incosyl-GML is useful for inducing an immunosuppressive action against cancer, neurological disease or small cell lung carcinoma.

                                                                                                                                                                                g
                                                                                                                                                                                                     \delta
                 The invention relates to rat GMI-specific alphal-2fucosyltransferase
(alphal-2FucT) enzyme and its corresponding nucleic acid. This nucleic
acid its specific for a carbohydrate moiety found in ganglioside GMI,
a terminal galactose betal-3W-acetylgalactosamine (Galbetal-3GalNAc)
saccharide. Alphal-2FucT DNA is useful for producing rat alphal-2FucT
protein by recombinant techniques. Alphal-2FucT DNA is useful for the
preparative synthesis of fucosyl containing glycolipids, glycoproteins,
glycolipoproteins and oligosaccharide, and for preparing fucosyl-GMI.
Alphal-2FucT DNA is useful for detecting oncogenic transformation which
involves assaying for changes in expression of alphal-2 FucT. Since
alphal-2FucT is activated in cell transformation, antisense sequences
derived from alphal-2FucT DNA are useful for inhibiting, suppressing
or treating cancer. Albhal-2FucT DNA is useful in gene therapy and
antisense therapy. The present sequence is at hepatoma H35 cell
calphal-2FucT catalytic domain encoding DNA.
                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                              180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This nucleotide sequence, designated clone pSe16.1, codes for porcine secretor (Se) glycosyltransferase (see ANAT785), an enzyme that has high affinity for type I and type III substrates. It was isolated from a pig liver genomic library using full-length human Se2 (FUT2) cDNA as probe. The nucleotide sequence shows about 36% homology with human FUT1. Introduction of glycosyltransferase nucleic acid, such as porcine Se nucleic acid, into a tissue results in reduced expression of unwanted carbohydrate epitopes on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GCAAAAGGAGTCACTTGTTACGTCGCAGGAAGAGCCTTCTGATGGGAA 1149
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid encoding glycosyltransferase able to compete with second such enzyme - particularly used to reduce expression of unwanted carbohydrate epitope(s) on tissues intended for
